# Practical 4:- To determine maximum temperature using Hadoop MapReduce

**Map Reduce**: works by breaking the processing into two phases: the map phase and the reduce phase. Each phase has key-value pairs as input and output, the types of which may be chosen by the programmer. The programmer also specifies two functions: the map function and the reduce function.

## Hadoop MaxTemprature operation occurs in 3 stages -

Mapper Phase

Reducer Phase

Driver code

### **Dataset** – temperature.txt

006701199099991950051507004+68750+023550FM-12+038299999V0203301N00671220001CN9999999N9+00001+999999999

004301199099991950051512004+68750+023550FM-12+038299999V0203201N00671220001CN9999999N9+00221+999999999

004301199099991950051518004+68750+023550FM-12+038299999V0203201N00261220001CN9999999N9-00111+999999999

0043012650999991949032412004+62300+010750FM-12+048599999V0202701N00461220001CN0500001N9+01111+9999999999

0043012650999991949032418004+62300+010750FM-12+048599999V0202701N00461220001CN0500001N9+00781+9999999999

These lines are presented to the map function as the key-value pairs

 $\begin{array}{l} (0,0067011990999991950051507004...9999999N9+00001+99999999999...) \ (106,0043011990999991950051512004...9999999N9+00221+99999999999...) \ (212,004301199099991950051518004...9999999N9-00111+9999999999...) \ (318,004301265099991949032412004...0500001N9+01111+99999999999...) \ (424,0043012650999991949032418004...0500001N9+00781+99999999999...) \end{array}$ 

The keys are the line offsets within the file, which we ignore in our map function. The map function merely extracts the year and the air temperature (indicated in bold text), and emits them as its output (the temperature values have been interpreted as integers):

(1950, 0)

(1950, 22)

The output from the map function is processed by the MapReduce framework before being sent to the reduce function. This processing sorts and groups the key-value pairs by key. So, continuing the example, our reduce function sees the following input:

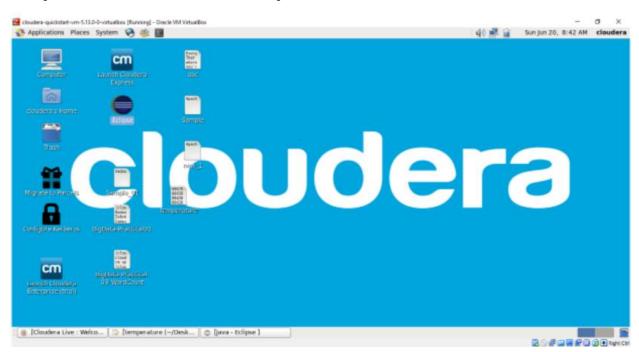

(1949, [111, 78]) (1950, [0, 22, -11])

Each year appears with a list of all its air temperature readings. All the reduce function has to do now is iterate through the list and pick up the maximum reading:

(1949, 111)

(1950, 22)

1) Open virtual box and then start cloudera quickstart

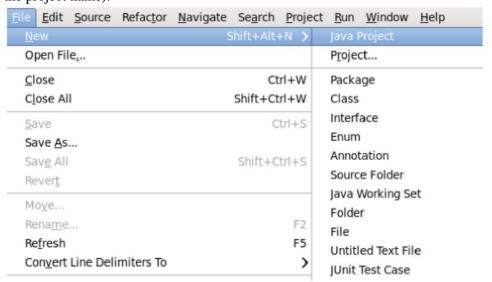

2) Open Eclipse present on the cloudera desktop

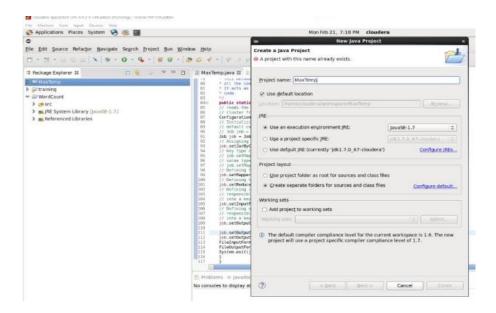

Name: - Zen Dsouza

Roll No: - 34 Subject - BDT

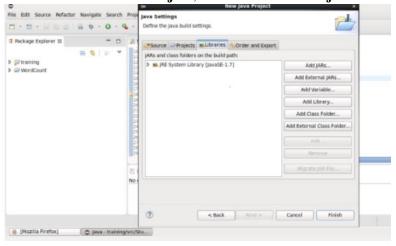

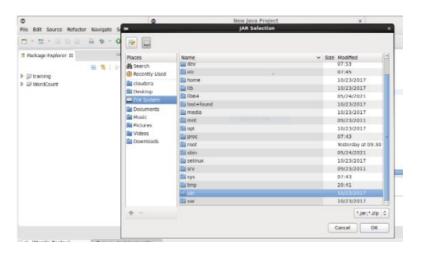

3) Create a new Java project clicking: **File** -> **New** -> **Project** -> **Java Project** -> Next ("**MaxTemp**" is the project name).

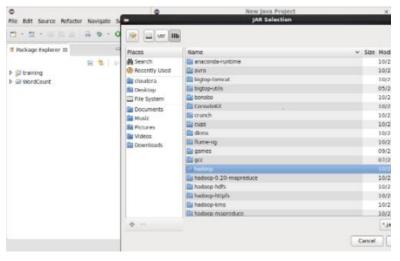

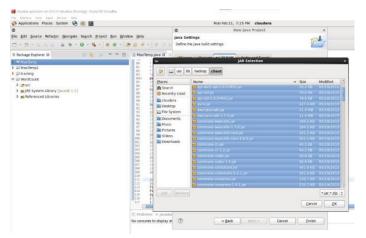

4) Adding the Hadoop libraries to the project Click on **Libraries** -> Add External JARs Click on **File System** -> **usr** -> **lib** -> Hadoop Select all the **libraries** (**JAR Files**) -> click **OK** Click on Add **External jars**, -> **client** -> select all **jar files** -> **ok** -> **Finish**.

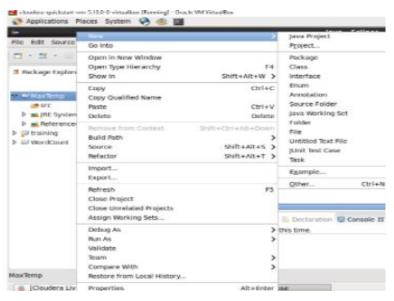

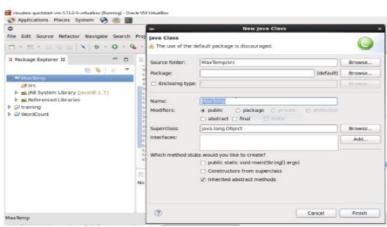

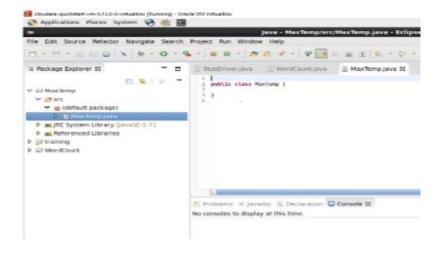

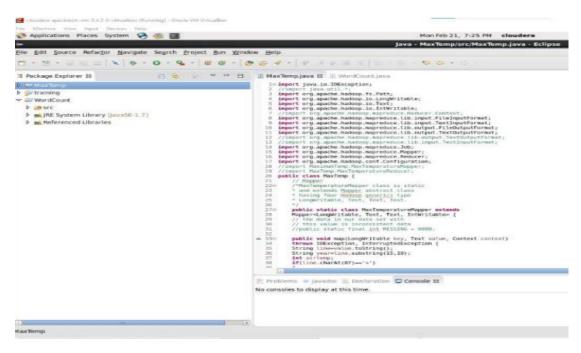

5) Right Click on the name of Project "MaxTemp" -> New -> class don't write anything for package Write Name Textbox write "MaxTemp" -> Finish Then MaxTemp.java window will pop up.

Subject - BDT

```
// responsible to parse the dataset
// into a key value pair
job.setOutputFormatClass(TextOutputFormat.class);

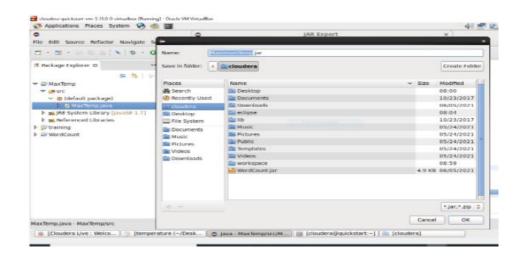

job.setOutputKeyClass(Text.class);
job.setOutputValueClass(IntWritable.class);

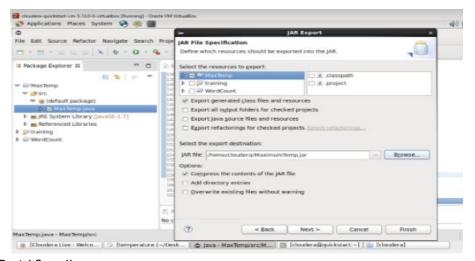

FileInputFormat.addInputPath(job, new Path(args[0]));
FileOutputFormat.setOutputPath(job, new Path(args[1]));
System.exit(job.waitForCompletion(true) ? 0 : 1);
}
```

6) Right Click on the project name MaxTemp -> Export -> Java -> JAR File -> Next -> for select the export destination for JAR file: browse -> Name : MaxTemp.jar -> save in folder -> cloudera -> Finish -> OK

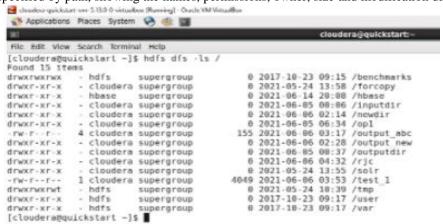

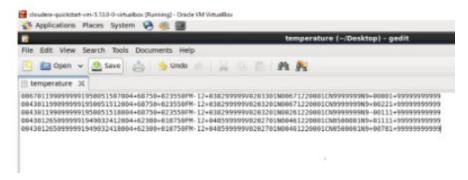

7) Open terminal & type ->hdfs dfs -ls / HDFS Command to display the list of Files and Directories in HDFS. It lists the contents of the directory specified by path, showing the names, permissions, owner, size and modification date for each entry.

**8)** Input file named as temperature which is present on desktop i.e. in local file system.

9) Now we have to move this input file to hdfs. For this we create a directory on hdfs using command ->hdfs dfs -mkdir /tempip.

So here I create tempip directory.

```
[cloudera@quickstart ~]$ hdfs dfs -mkdir /tempip
[cloudera@quickstart ~]$ hdfs dfs -ls /tempip
```

Then we can verify whether this directory is created or not using Is command hdfs dfs -ls /

```
|cloudera@quickstart -|s hdfs dfs -ls /

                                      pergroup
[cloudera@quickstart -]$ ■
6 [Cloudera Live : Welco... | [] [temperature (-/Desk... | © [Java - MaxTemp/src/... | ]] cloudera@quickstart:-
```

10) Move the input file i.e. temperature to this directory created in hdfs by using either put command or copyFromLocal command.

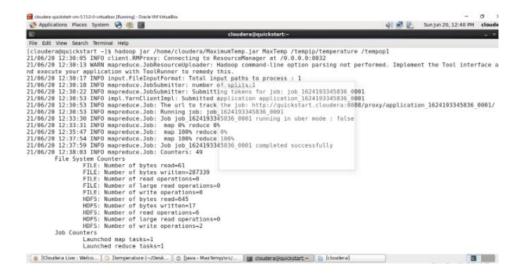

hdfs dfs -put /home/cloudera/Desktop/temperature /tempip/

```
[cloudera@quickstart ~]$ hdfs dfs -put /home/cloudera/Desktop/temperature /tempip/[cloudera@quickstart ~]$
```

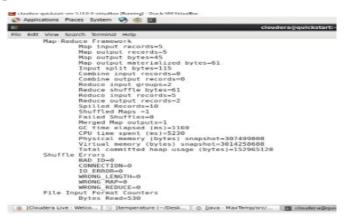

11) Now checking whether the "temperature" present in /tempip directory of hdfs or not using hdfs dfs –ls/tempip command

**12)** As we can see "temperature" file is present in /tempip directory of hdfs. Now we will see the content of this file using hdfs **dfs -cat** /**tempip/temperature** command.

- **13**) Running Mapreduce Program on Hadoop, syntax is hadoop jar jarFileName.jar ClassName /InputFileAddress /outputdir
  - $i.e.\ hadoop\ jar\ /home/cloudera/MaximumTemp.jar\ MaxTemp\ /tempip/temperature\ /tempop1$

#### **Map-Reduce Framework**

- **14)** Verify the content of tempop1 directory and in that part-r file has the actual output by using the command Hdfs dfs -cat /tempop1/part-r-00000. This will give us final output. The same file can also be accessed using a browser. For every execution of this program we need to delete the output directory or give a new name to the output directory every time.
  - checking whether the tempop1 directory is created in hdfs or not using command
  - -> hdfs dfs -ls /

```
[cloudera@quickstart ~]$ hdfs dfs -ls /

hdfs dfs -cat /tempop1/part-r-00000

```
[cloudera@quickstart ~]$ hdfs dfs -cat /tempop1/part-r-00000
1949 111
1950 22
[cloudera@quickstart ~]$ ■
```

Name: - Zen Dsouza Roll No: - 34

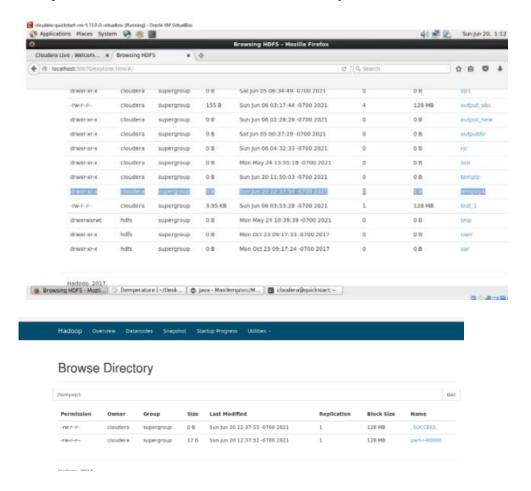

**Subject - BDT** 

So the maximum temperature for the year 1949 is 111 and for the year 1950 is 22.

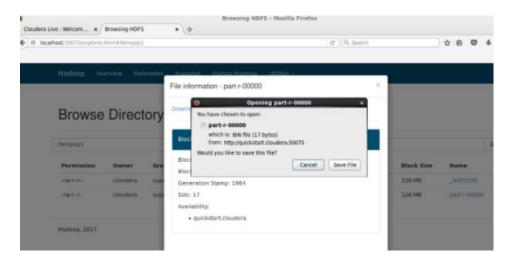

**15)** The same file can also be accessed using a browser.

Browse the Directory by

Hadoop->HDFS Namenode->Ultilities ->Browse the file system

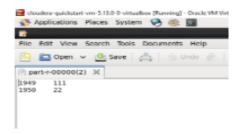

Now downloading the part-r-00000 file.

Inside the **part-r-00000** file it will have the same output as we are getting after executing using command.

-hadoop jar /home/cloudera/MaximumTemp.jar MaxTemp /tempip/temperature/tempop1

NOTE: - For every execution of this program we need to delete the output directory or give a new name to the output directory every time.
